

CLAIMS

What is claimed is:

1. A connector comprising:
 - a cavity in a connector housing which receives a female terminal;
 - an elastically deformable lance, formed on a side wall of said cavity, for unremovably locking said female terminal into said connector housing;
 - a terminal insertion opening formed on a front wall of said cavity for receiving a tab of a mating male terminal;
 - a tapered guide surface formed on a front peripheral edge of said terminal insertion opening to guide said tab of said male terminal into said terminal insertion opening;
 - a jig insertion opening formed forward from said lance by cutting off a part of said front peripheral edge of said terminal insertion opening to enable insertion of a jig for forcibly elastically deforming said lance to unlock said female terminal; and
 - an auxiliary member having a guide surface for supplementing at least one portion of said cut-off part formed thereon can be mounted on said connector housing.
2. A connector according to claim 1, wherein a retainer for unremovably doubly locking said female terminal unremovably is mounted in said cavity, said retainer has a guide surface for partly supplementing said cut-off part.
